

ALL YOU NEED TO KNOW

about Xpres Craft Inkjet Transfer Papers

INKJET DARK

1

On Silhouette Studio 'Page Setup' set your page size to A4 (using a cutting matt is optional but not required) and select 'Registration Marks' – Style Type 1 (Cameo, Portrait, Curio). Create your artwork within the registration marks.

2

Once your design is sized and positioned you will need to add your cut lines, this can be done by using the 'Trace' tool. The 'Offset' tool can also be a handy feature to add a contour.

3

Once the image and cut lines are finalised you are ready to print. Load into your printer so the smooth matt side of the inkjet Dark paper is the print face.

4

Through Silhouette Studio, send the page to print via your Inkjet Printer. We recommend your paper type is set to Plain Paper and use a high-quality setting such as 'Photo'. You will note that the registration marks will be printed on your A4 page as well as your design.

5

Once printed you are now ready to cut your design. Load your printed A4 sheet of Inkjet Dark facing upwards into your Cameo cutter. Make sure this is loaded in the same way as it looks on the Silhouette Studio. (small black registration square is in the left top corner).

6

On Silhouette Studio go to 'Send'. Your cut lines should now be highlighted. Initially you will need to set up a new cutting material for 'InkJet Dark'. The settings we recommend are found below.

7

When you send your design to cut, your Cameo will automatically search and read the Registration marks, and this will use these to line up the cut lines around the design printed.

8

Once complete, unload your A4 Inkjet Dark Sheet. You will now need to weed away the excess material around your design.

9

Once the excess material is removed, peel off your design from the backing of the Inkjet Dark. This is now ready for pressing.

10

Set your heat press to 160 degrees. Pre-press your garment for 3-5 seconds to remove any creases and moisture.

11

Position your transfer facing upwards onto the garment and cover with a protective silicone sheet. Press at medium pressure for 15 seconds.

12

Once pressed, remove the silicone sheet cold and your transfer is complete.
